

Software - KeyReplacer

KeyReplacer

Have you ever had a keyboard that is missing some keys?
Do you need localized characters on a keyboard that does not have them?
Perhaps you are using software like LogMeIn or GoToMyPC which doesn't support some Unicode characters (especially while using a Pocket PC)?
KeyReplacer monitors the keys pressed on the keyboard. If you enter a "receive key combination" the program will replace the written characters with the "Replace with" string. For example: You write ".aa" and the program erases ".aa" and replaces it with "å".
(Warning! The program can also be used for having some fun... :P) It also features simple open and save functions. It stores the configurations in ini-files. Sometimes you want KeyReplacer to start a program on startup or after reboots automatically. This is easily solved by creating a shortcut where the target is set to something like this:
"c:\path-to-program\keyreplacer.exe" "c:\mykeysettings.ini"

Clicking the minimize button will minimize KeyReplacer to the System Tray. Screenshots
